

diamond_heterogeneous candidate routes

Data do not support claiming a single fixed route for every planner/trial - see caption

shortest-hop route (2 hops, lower fidelity)

used when feasible by L1/L2/L2-R/L3/L3-R

(ShortestHopCountRouting - fixed, no alternative evaluated)

alternative route (3 hops, higher fidelity)

ALWAYS selected by L4 in the tested boundary trials (candidate evaluation)

also used by shortest-hop planners in a subset of trials (120/250) where the 2-hop route was infeasible
