

Overhead decomposition: IBQN orchestration vs. simulation wall time

(A) Total wall time per condition

(B) IBQN orchestration sub-stages (note the y-axis scale vs. panel A)

intent_parsing/intent_validation always 0 here (intent passed as an already-built object, not a file);
route_application is not isolated from deployment; persistence is not measured on this instrumented path
(the instrumentation defines 12 timing fields; 10 are observable in this instrumented path - see docs/overhead_methodology.md).
